

THE POPPY STUDY

'Patient reported outcomes, postoperative pain and pain relief after day case surgery'

Are you having day-case surgery?

You may be asked to speak to a researcher today. We are recruiting adults undergoing day-case surgery to a national study

The aim of this study is to find more about how well patients recover from surgery at home, particularly looking at their experience of pain and use of pain relief

This information would be used to produce reports and presentations and ultimately aims to help improve the care of others in the future

It is optional, nothing will change about your care today whether you take part or not

In addition to information collected on your day of surgery, you will receive **text messages** on days one, three, seven after your surgery, and a final text message three months after your surgery to ask how you are recovering

All data is stored securely and pseudo-anonymised
